Find the Highest Altitude

```
class Solution {  
    public int largestAltitude(int[] gain) {  
        int maxHeight = 0;  
        int currHeight = 0;  
  
        for (int g : gain) {  
            currHeight += g;  
            maxHeight = Math.max(maxHeight, currHeight);  
        }  
  
        return maxHeight;  
    }  
}
```

The screenshot displays a coding platform interface for the problem "1732. Find the Highest Altitude". The problem is marked as "Solved". The description states: "There is a biker going on a road trip. The road trip consists of $n + 1$ points at various altitudes. The biker starts his trip on point 0 with altitude equal 0. You are given an integer array `gain` of length `n` where `gain[i]` is the **net gain in altitude** between points `i` and `i + 1` for all $(0 \leq i < n)$. Return the **highest altitude** of a point."

Example 1:
Input: `gain = [-5,1,5,0,-7]`
Output: `1`
Explanation: The altitudes are `[0,-5,-4,1,1,-6]`. The highest is `1`.

Example 2:
Input: `gain = [-4,-3,-2,-1,4,3,2]`
Output: `3`

The solution is shown as "Accepted" with a runtime of 0 ms. The input is `gain = [-5,1,5,0,-7]` and the output is `1`. The expected output is also `1`. A "Contribute a testcase" button is visible.

The code editor on the right shows the following Java code:

```
1 class Solution {  
2     public int largestAltitude(int[] gain) {  
3         int maxHeight = 0;  
4         int currHeight = 0;  
5  
6         for (int g : gain) {  
7             currHeight += g;  
8             maxHeight = Math.max(maxHeight, currHeight);  
9         }  
10  
11         return maxHeight;  
12     }  
13 }
```
