Remove Duplicates from Sorted Array

```
class Solution {
    public int removeDuplicates(int[] nums) {
        if (nums.length == 0) return 0;

        int i = 1;

        for (int j = 1; j < nums.length; j++) {
            if (nums[j] != nums[i - 1]) {
                nums[i] = nums[j];
                i++;
            }
        }

        return i;
    }
}
```

The screenshot displays a coding platform interface for the problem "26. Remove Duplicates from Sorted Array". The problem description states: "Given an integer array `nums` sorted in non-decreasing order, remove the duplicates **in-place** such that each unique element appears only **once**. The **relative order** of the elements should be kept the **same**." It also mentions that the number of unique elements is `k`, and the first `k` elements of `nums` should contain the unique numbers in sorted order. The interface shows two test cases, both of which are "Accepted". The input for both cases is `[1,1,2]` and the expected output is `[1,2]`. The code editor on the right shows the following Java code:

```
1 class Solution {
2     public int removeDuplicates(int[] nums) {
3         if (nums.length == 0) return 0;
4
5         int i = 1;
6
7         for (int j = 1; j < nums.length; j++) {
8             if (nums[j] != nums[i - 1]) {
9                 nums[i] = nums[j];
10                i++;
11            }
12        }
13
14        return i;
15    }
16 }
```
