Remove Element

```
class Solution {  
    public int removeElement(int[] nums, int val) {  
        int index = 0;  
        for (int i = 0; i < nums.length; i++) {  
            if (nums[i] != val) {  
                nums[index] = nums[i];  
                index++;  
            }  
        }  
        return index;  
    }  
}
```

The screenshot displays a coding platform interface with three main sections:

- Submissions:** Shows the problem title "27. Remove Element" with a "Solved" status. It includes tags for "Easy", "Topics", "Companies", and "Hint". The problem description states: "Given an integer array `nums` and an integer `val`, remove all occurrences of `val` in `nums` **in-place**. The order of the elements may be changed. Then return the number of elements in `nums` which are not equal to `val`." It also provides a "Custom Judge" section with the following code:

```
int[] nums = {...}; // Input array  
int val = ...; // Value to remove  
int[] expectedNums = {...}; // The expected
```
- Testcase > Test Result:** Shows the test results for "Case 1" and "Case 2". Both cases are marked as "Accepted". The input for Case 1 is `nums = [3,2,2,3]` and `val = 3`. The output is `[2,2]` and the expected output is also `[2,2]`. A "Contribute a testcase" link is visible.
- Code:** Displays the Java code for the solution, which is the same as the code provided in the first block of the image.
