Find Pivot Index

```
class Solution {
    public int pivotIndex(int[] nums) {
        int len = nums.length;
        int rightSum = 0;
        int leftSum = 0;

        for (int i = 0; i < len; i++) {
            rightSum += nums[i];
        }

        for (int i = 0; i < len; i++) {
            if (leftSum == rightSum - leftSum - nums[i]) {
                return i;
            }
            leftSum += nums[i];
        }
        return -1;
    }
}
```

Editorial Solutions Description

724. Find Pivot Index

Solved

Easy Topics Companies Hint

Given an array of integers `nums`, calculate the **pivot index** of this array.

The **pivot index** is the index where the sum of all the numbers **strictly** to the left of the index is equal to the sum of all the numbers **strictly** to the index's right.

If the index is on the left edge of the array, then the left sum is 0 because there are no elements to the left. This also applies to the right edge of the array.

Return the **leftmost pivot index**. If no such index exists, return `-1`.

Example 1:

Input: `nums = [1,7,3,6,5,6]`
Output: 3
Explanation:
The pivot index is 3.
Left sum = `nums[0] + nums[1] + nums[2] = 1 + 7 + 3 = 11`

Accepted Runtime: 0 ms

Case 1 Case 2 Case 3

Input

`nums =`
`[1,7,3,6,5,6]`

Output

3

Expected

3
