Richest Customer Wealth

```
class Solution {  
    public int maximumWealth(int[][] accounts) {  
        int rich = 0;  
        for (int[] i : accounts) {  
            int sum = 0;  
            for (int money : i) {  
                sum += money;  
            }  
            rich = Math.max(rich, sum);  
        }  
        return rich;  
    }  
}
```

The screenshot displays the LeetCode interface for problem 1672, "Richest Customer Wealth". The problem description states: "You are given an $m \times n$ integer grid `accounts` where `accounts[i][j]` is the amount of money the i^{th} customer has in the j^{th} bank. Return the **wealth** that the richest customer has." It also provides an example: "Input: `accounts = [[1,2,3],[3,2,1]]`, Output: 6, Explanation: 1st customer has wealth = 1 + 2 + 3 = 6, 2nd customer has wealth = 3 + 2 + 1 = 6. Both customers are considered the richest with a wealth of 6 each, so return 6."

The "Testcase" tab shows the test result as "Accepted" with a runtime of 0 ms. The input is `accounts = [[1,2,3],[3,2,1]]`, the output is 6, and the expected result is 6. The "Code" tab shows the submitted Java code:

```
1 class Solution {  
2     public int maximumWealth(int[][] accounts) {  
3         int rich = 0;  
4         for (int[] i : accounts) {  
5             int sum = 0;  
6             for (int money : i) {  
7                 sum += money;  
8             }  
9             rich = Math.max(rich, sum);  
10        }  
11        return rich;  
12    }  
13 }
```
