Day of the Year

```
class Solution {
    public int dayOfYear(String date) {

        int year = Integer.parseInt(date.substring(0, 4));
        int month = Integer.parseInt(date.substring(5, 7));
        int day = Integer.parseInt(date.substring(8, 10));

        int[] daysInMonth = {31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31};

        if (isLeapYear(year)) {
            daysInMonth[1] = 29;
        }

        int totalDays = day;
        for (int i = 0; i < month - 1; i++) {
            totalDays += daysInMonth[i];
        }

        return totalDays;
    }

    private boolean isLeapYear(int year) {

        return (year % 4 == 0 && year % 100 != 0) || (year % 400 == 0);
    }
}
```

The screenshot displays a coding platform interface with three main panels. The left panel, titled 'Submissions', shows the problem '1154. Day of the Year' with a 'Solved' status. It includes the problem description: 'Given a string date representing a Gregorian calendar date formatted as YYYY-MM-DD, return the day number of the year.' and two examples. Example 1: Input: date = "2019-01-09", Output: 9, Explanation: Given date is the 9th day of the year in 2019. Example 2: Input: date = "2019-02-10", Output: 41. Constraints are listed at the bottom: date.length == 10 and date[4] == date[7] == '-', and all other date[i]'s are digits. The middle panel, 'Testcase > Test Result', shows 'Accepted' status with a runtime of 0 ms. It displays two test cases, both passing. The right panel, '</> Code', shows the Java code for the solution, which matches the code provided in the previous block.
