Largest Number

```
class Solution {
    public String largestNumber(int[] nums) {
        String[] arr = new String[nums.length];

        for (int i = 0; i < nums.length; i++) {
            arr[i] = String.valueOf(nums[i]);
        }

        Arrays.sort(arr, (a, b) -> (b + a).compareTo(a + b));

        if (arr[0].equals("0")) return "0";

        StringBuilder sb = new StringBuilder();
        for (String s : arr) sb.append(s);
        return sb.toString();
    }
}
```

The screenshot displays a coding platform interface for the problem "179. Largest Number". The problem description states: "Given a list of non-negative integers `nums`, arrange them such that they form the largest number and return it. Since the result may be very large, so you need to return a string instead of an integer." It includes two examples: Example 1 with input `nums = [10, 2]` and output `"210"`; Example 2 with input `nums = [3, 30, 34, 5, 9]` and output `"9534338"`. Constraints specify `1 <= nums.length <= 100`. The solution is marked as "Accepted" with a runtime of 1 ms. The Java code is shown in a separate window, matching the code provided in the previous block.

179. Largest Number Solved ✓

Medium Topics Companies

Given a list of non-negative integers `nums`, arrange them such that they form the largest number and return it.

Since the result may be very large, so you need to return a string instead of an integer.

Example 1:

Input: `nums = [10, 2]`
Output: `"210"`

Example 2:

Input: `nums = [3, 30, 34, 5, 9]`
Output: `"9534338"`

Constraints:

- `1 <= nums.length <= 100`

Accepted Runtime: 1 ms

Case 1 Case 2

Input

`nums =`
`[10, 2]`

Output

`"210"`

Expected

`"210"`
