Number of Days Between Two Dates

```
class Solution {
    public int daysBetweenDates(String date1, String date2) {
        int days1 = days(date1);
        int days2 = days(date2);
        return Math.abs(days1 - days2);
    }

    int[] mdays = {0, 31, 59, 90, 120, 151, 181, 212, 243, 273, 304, 334, 365};

    private int days(String d) {
        String[] ss = d.split("-");
        int year = Integer.valueOf(ss[0]);
        int month = Integer.valueOf(ss[1]);
        int day = Integer.valueOf(ss[2]);

        int ydelta = year - 1 - 1900;
        int dy = ydelta * 365 + ydelta / 4;

        int dm = mdays[month - 1];
        if (isleap(year) && month - 1 >= 2) {
            dm++;
        }
        return dy + dm + day;
    }

    private boolean isleap(int year) {
        return (year % 100 != 0 && year % 4 == 0) || (year % 100 == 0 && year % 400 == 0);
    }
}
```

The screenshot displays a coding platform interface. On the left, the problem description for '1360. Number of Days Between Two Dates' is visible, including the task to write a program to count the number of days between two dates and two examples. The main area shows the solution code in Java, which is identical to the code provided in the previous block. The code is marked as 'Accepted' and shows a runtime of 0 ms. The input and output fields are filled with the test cases from the examples: Example 1 (date1: '2019-06-29', date2: '2019-06-30', output: 1) and Example 2 (date1: '2020-01-15', date2: '2019-12-31', output: 15).
